

go to

After checking that the delimiter is used to start a statement, DECSTA is set to /o o to show this is a statement. The delimiter is stacked as GT since it is not yet known if this is a go to label or go to switch statement.

e.g. go to labelname;

go to s [a+b] ;

E and EXPTYP are set up for the following label or switch expression.

ERRORS

FAIL 42 ; go to follows an identifier or constant.
